Simplify and Streamline Video System Management with CES Mass Management

Command Enterprise Software Mass Management revolutionizes video system administration by providing tools to efficiently manage and update cameras and devices. Designed for large-scale deployments, it centralizes control, reduces manual effort, and enhances security. Whether managing March Networks or third-party cameras, CES Mass Management ensures smooth, effective operations.

Key Benefits

Efficient Mass Management

Perform firmware upgrades, password management, and configuration changes across multiple devices simultaneously, reducing manual workload and on-site technical support needs.

Enhanced Security

CES generates and stores randomized passwords for devices, ensuring robust protection. Passwords are regenerated automatically after use for added security.

Centralized Scheduling

Link schedules to multiple devices, enabling automatic updates across all connected devices when changes are made.

Simplified Operations

Manage both March Networks and third-party cameras with ease, using targeted updates and unified workflows.

Features

Password Management

Retrieve, generate, and regenerate device passwords automatically to prevent unauthorized access. Securely disclose passwords for temporary use and reset them after a configurable time frame.

Unified Scheduling

Create centralized schedules for bandwidth throttling, recording, events, and alarms, with automatic updates to all linked devices.

Camera Mass Management

Configure settings, update firmware, and manage multiple devices in bulk, supporting efficient and large-scale deployments.

Multi-Device Support

Manage March Networks and third-party cameras seamlessly, ensuring compatibility and streamlined workflows.

Use Cases

Large-Scale Deployments for Multi-Site Organizations: Apply targeted configurations and updates to hundreds of cameras at once, reducing downtime and effort. Use centralized scheduling to maintain consistency and streamline system operations across multiple locations.

Cost Savings Through Reduced Tech Support Truck Rolls: With remote access for firmware upgrades, configuration changes, and password management, businesses can significantly reduce the need for on-site technician visits. For example, instead of sending a technician to manually reset passwords or update camera settings, administrators can perform these tasks remotely via CES, saving time, reducing labor costs, and avoiding operational disruptions.
